ACKNOWLEDGEMENTS

This report was prepared by Diane Green of the APIOS Atmospheric Deposition and Chemistry Program. However, the data themselves are a product of the combined efforts of many individuals. Collection of samples was coordinated by Bill Trayling (in Northeastern Region), Steve Elliott (in Southeastern Region), Scott Kennedy (in Southwestern Region), Wim Smits (in Northwestern Region) and J. P. Varto (in Central Region). Sample handling was carried out by Mike Stevenson and overall coordination by Bill Bardswick at the Air Resources Branch. Chemical analyses were performed at the Laboratory Services and Applied Research Branch under the coordination of Frank Tomassini. Invaluable clerical and computer assistance were provided by Koshy Mathew and Joe Lamb, respectively, of C.C. and C. Computer Systems. All enquiries regarding the reported data should be directed to Neville Reid, Co-Ordinator, Atmospheric Deposition and Chemistry Program at (416) 965-1634.

PART I
INTRODUCTION

INTRODUCTION

This report was prepared by Diane Green. The statistical summaries presented in this report pertain to the 1986 analytical results obtained from the Acidic Precipitation in Ontario Study (APIOS) cumulative precipitation monitoring network. The relevant data can be obtained on request from the Air Resources Branch of The Ontario Ministry of the Environment. All available data are utilized in the calculations except results reported as being unreliable (i.e., results are identified as unreasonable values by using the validation procedures; detailed description of the validation procedures is available from the Ministry upon request) or approximate (i.e., inexact results are reported due to laboratory difficulties, such as may be encountered in calibration, or when the sample cannot be re-analyzed to confirm the reported value). In a very few cases, concentration levels exceeded the upper limit of the range of the chemical analysis. Rather than using the upper limit, a decision was made to exclude these values from the statistics generated in this report. Reported results for metals which have missing leachate analysis are also excluded from statistical analysis. Results labelled as <W are replaced by "zero". W is the level which the analytical technique cannot distinguish from zero. Prior to 1986, if a level was recorded less than the detection limit T, a value corresponding to one half the detection limit was utilized for statistical calculations as reported in the statistical summaries. These values are no longer halved. Note that T is normally about ten times W, and values above the T criteria are considered to be precise and accurate.

The reported cumulative precipitation gauge depth (or an interpolated value from Environment Canada's CLIMAT data) is utilized in the calculation of deposition. If a precipitation gauge value is not available, then the collected sample volume is converted to its equivalent precipitation depth and is used in the deposition calculation.

The statistical summaries presented in Parts III to VI include number of samples, mean (arithmetic/geometric), standard deviation (arithmetic/geometric), maximum, minimum, quartiles and precipitation weighted means using precipitation gauge depths where appropriate. These statistics are for an average sampling period. Data which correspond to irregular sampling periods are either combined if they are from consecutive collection periods which span $28d \pm 5d$, or deleted, before the statistics are generated.

INTRODUCTION

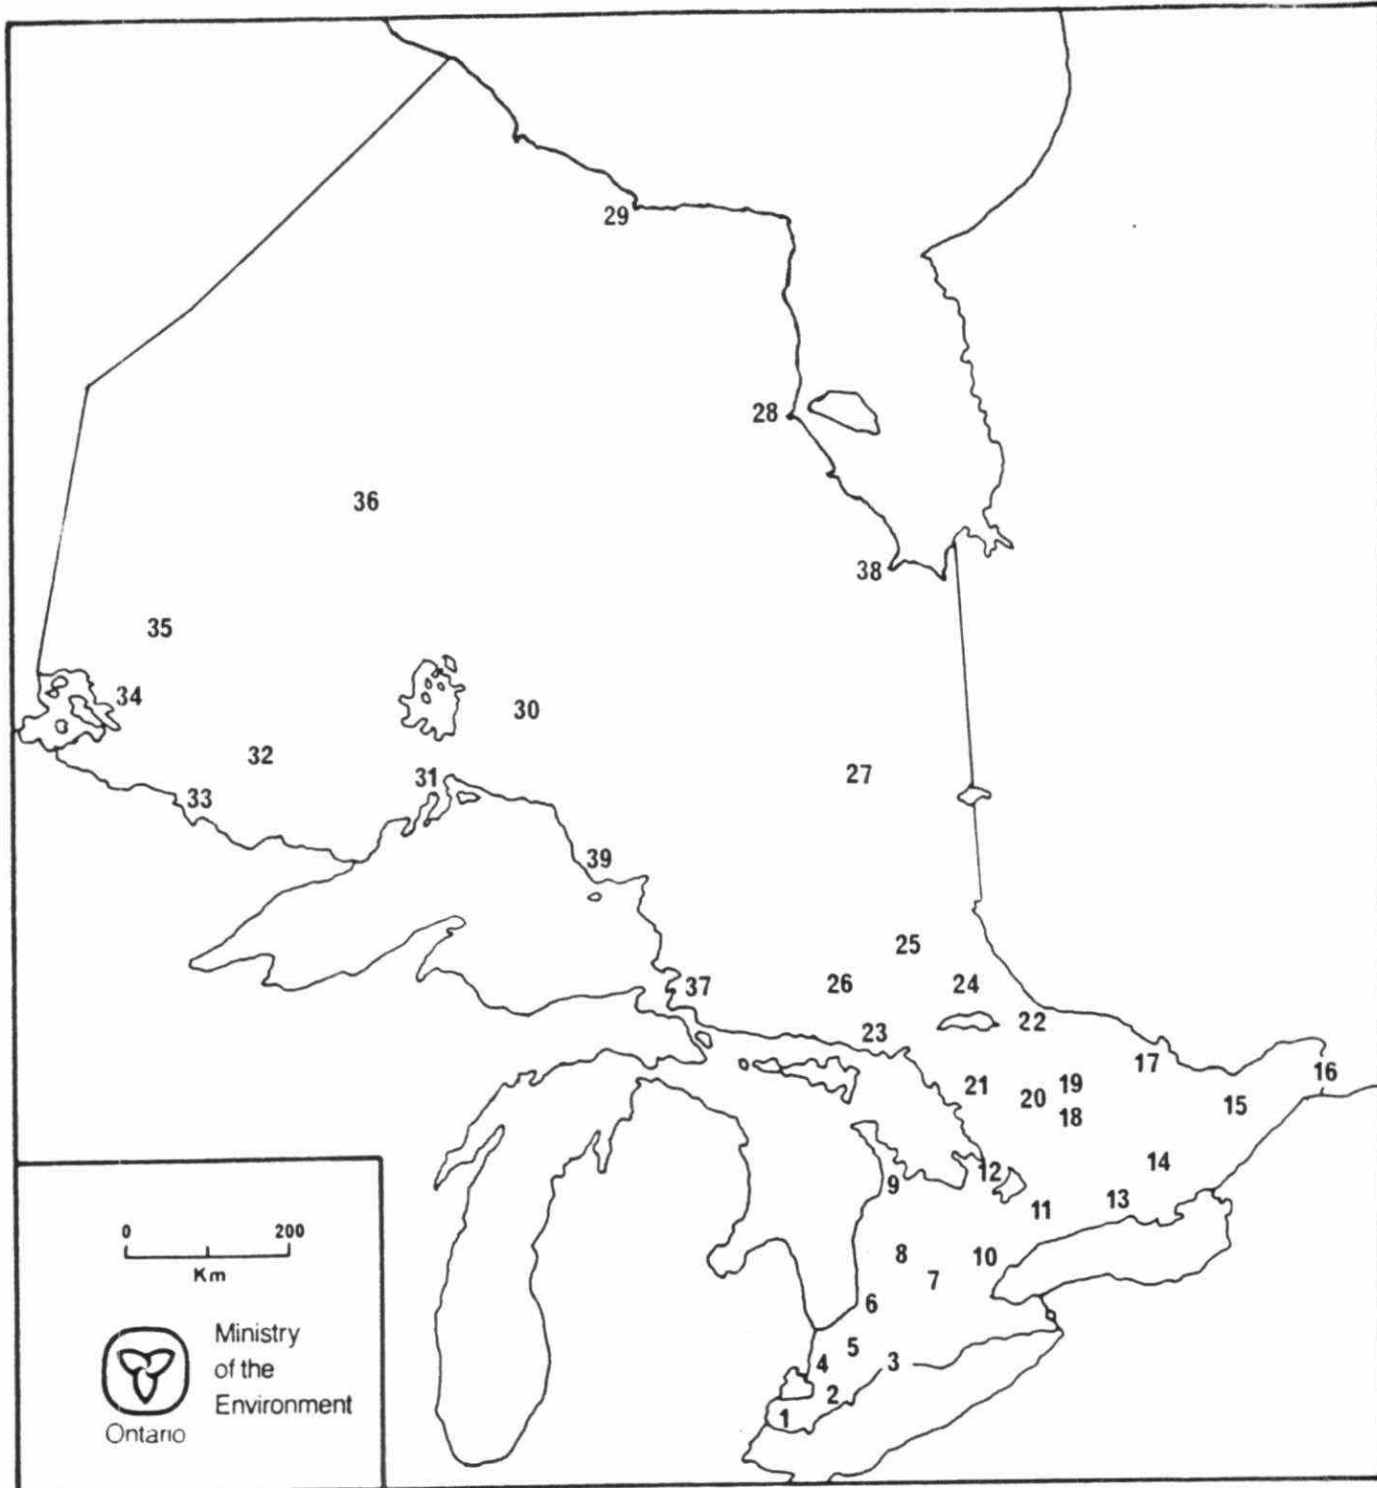

Le présent rapport a été préparé par Diane Green; il renferme les statistiques de 1986 tirées du réseau de surveillance des précipitations totales, réseau créé dans le cadre de l'Étude sur les précipitations acides en Ontario (APIOS). On peut obtenir les données pertinentes auprès de la Direction des ressources atmosphériques du ministère de l'Environnement. Toutes les données à notre disposition ont été utilisées dans les calculs, sauf celles jugées non fiables (c'est-à-dire les résultats qui, après vérification de leur validité, ont été signalés comme des valeurs excessives. On peut obtenir sur demande une description détaillée des procédés employés.) ou approximatives (c'est-à-dire les résultats qui, à cause de difficultés éprouvées en laboratoire, à la calibration, par exemple, ou lorsqu'il était impossible d'analyser à nouveau un échantillon pour confirmer la valeur indiquée, sont considérés comme inexacts). Dans quelques cas, les concentrations dépassaient le seuil supérieur fixé pour les analyses chimiques. Plutôt que d'utiliser le seuil supérieur, on a décidé d'exclure ces valeurs du présent rapport. De même pour les métaux dont les résultats d'analyse de lixiviation sont incomplets. Les résultats étiquetés <W sont remplacés par « zéro ». Dans le cadre d'une analyse technique, W correspond au niveau qu'il est impossible de distinguer du zéro. Avant 1986, si on mesurait un niveau inférieur au seuil de détection T, on utilisait aux fins d'analyse statistique une valeur correspondant à la moitié du seuil de détection, comme on l'indique d'ailleurs dans la présente étude. Ces valeurs ne sont plus coupées de moitié. Signalons que, normalement, T est environ dix fois supérieur à W et que les valeurs supérieures au seuil de détection T sont considérées comme justes et précises.

La hauteur totale des précipitations obtenue à l'aide du pluviomètre (ou une valeur interpolée obtenue à partir des données CLIMAT d'Environnement Canada), sert au calcul des dépôts. Si on ne peut obtenir de données à partir du pluviomètre, on convertira le volume de l'échantillon en hauteur des précipitations, et cette nouvelle donnée servira alors au calcul des dépôts.

Voici les différentes catégories de statistiques figurant dans les sections III à VI : le nombre d'échantillons, les moyennes (arithmétiques/géométriques), les écarts-types (arithmétiques/géométriques), le maximum, le minimum, les quartiles et la précipitation moyenne pondérée (calculée à l'aide de la hauteur totale des précipitations, le cas échéant). Toutes les statistiques représentent des périodes d'échantillonnage moyennes; les données correspondant à des périodes d'échantillonnage irrégulières ont été combinées, si elles ont été obtenues pendant des périodes consécutives de 28 jours (± 5 jours), ou supprimées avant le calcul des statistiques.
